The Problem (Statement):

It is far too easy to lose track of what groceries you already have vs what you need.

I often find myself annoyed trying to figure out what I need to order for my pantry or fridge, only to find out I didn't need to order anything as I had already it tucked away out of sight. I wish to remedy this problem in a way like how an online cart system works.

Much like how what you want to buy online is stored in a cart, I wish to do something much like things you already own. A way of taking inventory of your pantry or fridge without having to pull out and count everything inside to make sure it's in-date and not all out of something.

My solution is to create an app/program that connects to already existing grocery apps to help keep track of what you have. Whenever groceries are bought, they are added to a new list of items you have in your pantry/fridges, of which you can edit to include expiry dates and estimations of how much of something is left for you.
